

# Pokemon Store

You need to implement "Pokemon store" based on API from <http://pokeapi.co>. It should look as following:

Expected behaviour of "Pokemon store":

1. When user launch page we start our store with 12 pokemons (pokemon image, pokemon name, button "Buy") list and button "Load more" and with message "The Basket is empty" in the "Basket".
2. When user press "Load more" button we add next 12 pokemons chunk after existing pokemon and before button "Load more".
3. When user press "Buy" in some pokemon we need to disappear this pokemon and show a similar box in the basket with button "x"(delete).
4. When user press "x"(delete) in the box from "Basket" we need to delete pockemon from basket and show in the pokemon list.

Regarding API:

1. Get chunk of pokemon list <http://pokeapi.co/api/v1/pokemon/?limit=12>
2. Image of pokemon <http://pokeapi.co/media/img/{{id}}.png>

For this task you need to use pure js or jquery library and pure css.
